

Store dash-molecules; Study A, one repeat (seed 0); arms: sieve-element-pooled (55 runs), dash (40 runs). Points are individual folds; the line is their mean and the bars are the Nadeau-Bengio corrected standard error (Mach. Learn. 52:239, 2003), which accounts for the training molecules the 5 folds share -- they are not independent replicates. The dashed horizontal line in each panel marks the best value the other method reached for that metric.
