

Store dash-molecules; Study A, one repeat (seed 0); arms: sieve-element-pooled (55 runs), dash (40 runs). Points are individual folds; the line is their mean and the bars are the Nadeau-Bengio corrected standard error (Mach. Learn. 52:239, 2003), which accounts for the training molecules the 5 folds share – they are not independent replicates. The dashed horizontal line in each panel marks the best value the other method reached for that metric. Dotted lines are the same metric on each fold's own training shards, scored unnormalized. The sweep also covered sieve-element-pooled 0, not shown here.
